

Erstellung einer Subdomain für ein Webhostingpaket

Wenn Sie Ihr Webhostingpaket selber verwalten, haben Sie die Zugangsdaten für unser Konfigurationstool webmin bereits bekommen. Bitte loggen Sie sich mit diesen auf folgender Seite ein: <https://web.casc-hosting.com:10011/>

Schritt 1) Neuen Virtual Server anlegen, wie gewohnt

The screenshot shows the Webmin interface for creating a virtual sub-server. The browser window title is "Create Virtual Sub-Server". The Webmin header includes the logo, "sponsored by OpenCountry", and a "Log Out" link. The navigation menu shows "Webmin", "System", "Servers", and "Others". The "Module Index" is also visible.

The main content area is titled "Create Virtual Sub-Server" and contains a form for "New virtual server details". The form fields are:

- Domain name:** blah123.casc.at
- Description:** Forward to www.google.com
- Server configuration template:** Defaults Settings For Sub-Servers
- Parent server:** testing.topfen.net (testing)
- Default database name:** Automatic

Below the form are several checkboxes for optional configurations:

- Create home directory?
- Setup website for domain?
- Setup log file rotation?
- Setup DNS zone?
- Setup Webalizer for web logs?
- Create MySQL database?

A "Create Server" button is located at the bottom left of the form.

Schritt 2) Servers > Apache Webserver auswählen und den gerade erstellten Virtual Server anklicken;
dann das public_html Directory auswählen

The screenshot shows the Webmin interface for configuring a virtual server. The title bar reads "Virtual Server Options". The main header includes "Webmin" and "sponsored by OpenCountry". Below the header are navigation icons for "Webmin", "System", "Servers", and "Others", along with "Module Index" and "Apply Changes" buttons.

The main content area is titled "Virtual Server Options" and "For blah123.casc.at:80". Under "Virtual Server Details", there are 15 icons representing different configuration sections: Processes and Limits, Networking and Addresses, Log Files, Document Options, MIME Types, Error Handling, Aliases and Redirects, CGI Programs, Directory Indexing, SSL Options, PHP, Filters, Languages, and Show Directives.

The "Per-Directory Options" section at the bottom shows two directory entries. The first entry, for the path `/home/testing/domains/blah123.casc.at/public_html`, has its "Directory" icon circled in red. The second entry is for `/home/testing/domains/blah123.casc.at/cgi-bin`.

Schritt 3.) Aliases and Redirects anklicken

Per-Directory Options

Webmin sponsored by OpenCountry Log Out

Options apply to ..

Type Regexp? Exact match Match regexp

Path Save Delete

[Return to server index](#)

Schritt 4.) Gewünschte Aliases definieren. Im Feld URL redirects tragen Sie bitte folgendes ein: „/“ für gesamte Domain, „/verzeichnis“ für Unterverzeichnisse (Es können natürlich auch mehrere Redirects eingerichtet werden; dazu einmal auf Save klicken, wenn man das nächste mal den Dialog auswählt, gibt es eine neue leere Zeile.).
